AUTHOR: Zobnin, A. O.

TITLE: Letter to the editor

PERIODICAL: Liteynoye proizvodstvo, no. 1, 1961, 48

TEXT: In V. I. Ivanov's article: Application of exothermal mixtures with ferro-aluminum, (Liteynoye proizvodstvo, no. 4, 1960) some methods were described how to obtain aluminum shot. According to A. O. Zobnin, these methods are labor-consuming, inefficient, and expensive. Another method, applied successfully is recommended, requiring a container two thirds of which are filled with water. Air is supplied from the air mains to the nozzle, the air-flow being regulated by a tap. Molten aluminum is poured into the container from the ladle through a spout, made of 30 x 30 mm angle steel. While flowing through the spout the aluminum passes below the compressed air-jet and crumbles. By controlling air and aluminum feed, it is possible to obtain shot of various size. When water-cooled the shot sinks down to the container bottom. Even in this simple form the equipment is efficient. The output could be raised by mounting stationary ladle with a hole in the bot-

The loss in burning of steel in gas furnaces. B. F. Zohdani. Tsvl. Met. 1939, No. 6, 21-6; Akim. Referat. Zhur. 1939, No. 11, 80. - A bainomild forge-type furnace of a flameless construction with a 0.64 sq. m. furnace floor was fired, under excess-air coeff. of from 0.8 to 1.2, with purified peat generator gas (C₂H₆ 0.4, CH₄ 2.5, CO 24.0; H₂ 17.0, O₂ 0.2, CO₂ 0.5, N₂ 42.0, and H₂O) 3.75%, heat capacity 1450 cal./cu. m.). Samples of C steel 3 (C 0.30-0.40%), Cr steel (C 0.80-0.90%, Cr 1.40-1.70%), Ni ≤ 0.2%, Cr-Ni steel (C 0.20-0.30%, Cr 1.30-1.70%, Ni 4.0-4.70%) and Cr-Mo steel (C 0.30-0.38%, Cr 0.40-1.20%, Ni ≤ 0.3%, Mo 0.25-0.40%) 20 mm. in diam. and 70 mm. long were heated at 900°, 1100° and 1300° for 1 hr. The loss in burning of the slightly alloyed steels is the same as that of C steel. The loss depends mainly on the contents of water vapor and O₂ in the combustion products. With small concns. of the oxidizing gases (H₂O, O₂ and CO₂) in the products of combustion a change of their compns. affects the loss in burning more than with large concns. of the oxidizing gases. The antioxidizing effect of the combustion of gas with an insufficient supply of air increases when gaseous fuels are used which are richer in hydrocarbons and which have a low CO/H₂ ratio (0.1-0.8). AUTHOR: Zobnin, N.P.

TITLE: Durability of surface hardness of axles machined by rolling

SOURCE: Akademiya nauk SSSR. Komissiya po tekhnologii mashinostroyeniya. Seminar po kachestvu poverkhnosti. Trudy, no.5, 1961, Kachestvo poverkhnosti detalej mashin; metody i pribory, uprochneniye metallov, tekhnologiya mashinostroeniya, 64-70

TEXT: The service-life of railroad - car axles, and hence the safety of railroad transport, depends to a great extent on their surface hardness and mechanical strength. At present, a special technology for machining of railroad car axles by rolling is gaining increasing acceptance. In order to study the durability of surface hardness of axles so machined, the Laboratory for Metal Cutting, of the Moskovskiy Institut Inzhenerov zheleznodorozhnogo transporta (Moscow Institute for Engineers of Railroad Transport) carried out special experiments. 5 steel specimens were subjected to comparative cycling tests on a four-spindle test machine, after their machining by metal cutting and rolling. The tests were carried out in two stages 1). preliminary Card 1/2

Durability of surface...

5/14/61/000/005/003/014
1001/1207

stage-testing at 200 million cycles; 2). final stage small-dark testing at 500 million cycles. The test results, presented in tables, showed that the endurance limit of car axles increased by a factor of 1.93 which, under conditions of field operations, is of particular importance. Machining by rolling increases at the same time wear resistance, due to the work-hardening effect. The test results also revealed a sufficient durability of surface hardness of railroad-car axles machined by rolling. There are 2 figures and 3 tables.

PHASE I BOOK EXPLOITATION SOV/1215

Zobnin, Nikolay Pavlovich; Shishkin, Aleksey Alekseyevich; and Yudin,
Danilev L'vovich

Oborabotka metallov rezaniyem (Metal Cutting). Moscow, Transzheldor-
izdat, 1958. 256 p. 6,000 copies printed.

Ed. (Title page): Zobnin, N.P., Doctor of Technical Sciences,
Professor; Eds. (Inside book): Danilevskiy, V.V., Candidate of
Technical Sciences, Docent, and Braylovskiy, N.G., Engineer; Tech.
Ed.: Bobrova, Ye. N.

PURPOSE: This book is approved by the Ministry of Higher Education,
USSR, as a handbook for railroad transport vuzes. It may also
be useful to engineers and technicians in plants and in railroad
repair shops for rolling stock, wheels and track.

COVERAGE: The book presents the theoretical fundamentals of metal
cutting. The construction and operation of metal-cutting machinery

Card 1/10

Metal Cutting

SOV/1215

and instruments are described. The fundamentals of methods used in development of techniques of mechanical metal processing are discussed. The name of A.V. Gadolin is mentioned as having contributed to this field. There are 80 references, of which 74 are Soviet, 5 English and 1 German.

TABLE OF CONTENTS:

From the Authors

3

Introduction

4

Ch. I. Elements of the Geometry of Turning Cutting Tools
[Single-point Tools]

1. Basic parts, surfaces and angles of cutting tools 10
2. Change of tool angles 10

14

Ch. II. Fundamentals of Cutting-tool Manufacturing Methods
3. Requirements for cutting tools 17

17

Card 2/10

17

Metal Cutting	SOV/1215
4. Materials used for making the cutting part of turning cutting tools	17
5. Methods of making cutting tools	19
Ch. III. Elements of Cutting Process in Turning	28
6. Description of elements of cutting process and of the layer of metal removed	28
Ch. IV. Concept of Metal Deformations Occuring During the Cutting Process	28
7. Brief information on metal deformation in cutting	32
8. Types of chips	32
9. Chip shrinkage	33
10. Heap [of metal] on the cutting tool	35
11. Information on work deformation and on residual stresses on machined surface	37
Ch. V. Heat Phenomena in Metal Cutting	38
12. Heat generation and distribution in metal cutting	39
13. Methods of determining heat and temperature in metal cutting	39
14. Effect of basic factors on temperature in metal cutting	42

TITLE: The automation of the process of preparation of aqueous solutions of ammonia, amines, and sodium hydroxide

PERIODICAL: Referativnyy zhurnal, otdel'nyy vypusk, 47. Khimicheskoye i khologid'noye mashinostroyeniye, no. 1, 1963, 3, abstract 1.47.14 (Vestn. tekhn. i ekon. inform. N.-i. in-t tekhn.-ekon. issled. Gos. kom-ta Sov. Min. SSSR po khimii, no. 2, 1962, 31 - 34)

TEXT: A novel typical program of automatic control for the continuous preparation processes of binary solutions of given concentration was developed at the Gosudarstvennyy in-t prikladnoy khimii (State Institute of Applied Chemistry) which has been tested and introduced into production in many enterprises of the chemical industry. This program secures the maintenance, within given limits, of uniform concentration, temperature, and level of the solution in the reactor, feeding of the initial components, and discharge of the working solution prepared from the reactor in the amounts required. The automation program for

TEXT: Alloys were prepared with Cy -00 (Su-00) grade Sb, I "pure for analyses", and Te that was previously purified by double distillation in a vacuum. Specimens were prepared by alloying the components in evacuated sealed ampoules. Prior to taking the batches, Sb and Te were crushed in an agate mortar down to 40 mesh. I was taken in the form of individual crystals. The TeI, SbI₃, SbTeI compounds obtained possessed the following properties, respectively: melting point - 184, 171, and 360°C; electric resistivity 26.10⁶, 5.10⁵ and 1.6.10⁴ ohm.cm; width of the forbidden zone - 1.1; 1.67, and 1.57 ev. ↙

AUTHOR

ALEKSEVA, V.G., ZOBNINA, B.N., KARPOVA, I.V.
On the Influence of the Heating of Germanium on the Concentration of Thermal Acceptors by means of Electric Current. (Vliyaniye nagreva germaniya elektricheskim tekonom na konzentratsiyu termicheskikh akceptorov.)

PERIODICAL

Zhurnal Tekhn. Fiz., 1957, Vol 27, Nr 1, pp 215-217 (U.S.S.R.)

Received 4/1957

ABSTRACT

S.MAYBURG, Phys.Rev.95, 38 (1954) found that the concentration of the centers of accepters can be decreased considerably, if germanium is first heated for a long time in a vacuum by means of a parallel current. In order to decide whether the remanent thermeacceptors are lattice defects or atoms of the chemical admixtures, the authors tried to estimate the activation energy and the energetic properties on the occasion of the generation of these thermeacceptors.

The samples investigated of the germanium monocrystals had a specific resistance of 10 - 50 cm.Ohm and measured 2 x 3 x 15-18 mm. The samples were gebeized with 30% peroxyde, washed and then pressed vertically between two tantalum holders. These tantalum holders also served as electrodes. On the occasion of measuring the specific resistance tantalum probes were pressed onto the samples. When heating the samples by means of parallel current (if temperature remains below 700°C) no noticeable decrease of the concentration of the thermeacceptors is observed. At temperatures of more than 700° concentration of the thermeacceptors changes considerably. At first the n-type sample changes into a p-type of low resistance, this resistance then increases quickly and finally

Card 1/2

PA - 2184

On the Influence of the Heating of Germanium on the Concentration of Thermal Acceptors by means of Electric Current.

attains values very near the eigen value. The samples annealed by the alternating current at the same temperatures, changed into hole-like samples and their specific resistance (which first slightly increased) hardly changed at all in the course of further heating. The values of the concentration of the thermeacceptors after being heated by parallel current were almost lower by one order of magnitude than the concentration of the thermeacceptors after a heating by alternating current. A diagram illustrates the values of the thermeacceptors corresponding to equilibrium. The data obtained here indicate a decrease of concentration of the thermoacceptors (after a heating by parallel current) as a consequence of electrolysis. The remanent thermeacceptors are probably not due to lattice defects but to very small quantities of other chemical admixtures. (1 illustration)

Title : The Role of Renal Secretions in the Mechanics of Immunity

Orig Pub : Osnovy Immuniteta, Moskva, 1956, 95-100

Abstract : When mice susceptible to dysentery (D), and mice resistant to this infection, were infected with an active dysentery culture, a discharge of active dysentery culture, a discharge of active dysentery bacteriophage was observed in their urine. This may be estimated as a possible manifestation of a specific reaction of the organism, and one of the defense devices safeguarding against infection.

TITLE: Investigations of tellurium and antimony compounds with iodine

PERIODICAL: Referativnyy zhurnal, Fizika, no. 2, 1962, 31, abstract 2E295 (v sb.
"Vopr. metallurgii i fiz. poluprovodnikov", Moscow, AN SSSR, 1961,
110-112)TEXT: The authors describe physical properties and crystalline structure
of the following compounds: TeI, TeI_4 , SbI_3 , SbTeI . They investigated the
microhardness, electric conductivity, thermo-emf and heat conductivity of the
compounds: TeI, SbI_3 and SbTeI . Using the temperature dependence of electric
conductivity, they calculated the values of the widths of forbidden band which
turned out to be 1.1 ev for TeI, 2.5 for SbI_3 , and 2.1 ev for SbTeI . *✓*

TITLE:

Reactor Simulators II. Communication

PERIODICAL:

Energia ès Atomtechnika, 1960, Vol. 13, No. 8, pp. 372-376

TEXT: Simulation of Xenon Poisoning. - Of the two major reactor poisons Xe¹³⁵ alone is treated. The equations of the fission chain of Xe¹³⁵ are written down on the assumption that the immediate fission product be I¹³⁵. The change of the iodine and xenon concentrations with time is then expressed by differential equations ($\frac{dI}{dt} =$ and $\frac{dx}{dt} =$), where I and x are the numbers of nuclei per cm³ of I¹³⁵ and Xe¹³⁵, respectively. The analog computer circuit of Fig. 9 is designed in such a way that voltages proportional to the iodine and xenon concentrations may be taken off from two potentiometers. It is supposed that of the several factors of the effective multiplication factor, written down for the bare pile, only the thermal utilization factor is modified essentially, and that the former

Card 1/3

is proportional to the latter. As a result, the reactivity caused by poisoning is found to be proportional to the concentration of Xe. - V. The Experimental Model of the Reactor Power Plant. - The approximate equations for a pressurized water reactor (its heat circuit is given in Fig. 10) are written down, and on their basis the electrical model of the power plant proper is drawn in Fig. 11. Considering that the reactivity should have the character of a negative feedback, the principles of the model of a complete nuclear power plant and of the control system are shown in Fig. 12. VI. Measurement of Reactivity With the Reactor Simulator. - The reactivity of a reactor can be measured by determining the inverse function by analog computation. The principle and the measuring arrangement are shown in Figs. 13 and 14, respectively. Summary: The aim of the paper is to give a survey of publications available on reactor simulators and their uses. Estimates of the errors of analog computers as well as problems of their design are not considered. Excepting the xenon-poisoning simulator, only equipments operating with electron-tube amplifiers are shown. At the end of the article there are corrections of the errata in the first publication. There are 6 figures and 11 references: 1 Soviet, 3 US, 4 German, and 1 French.

AUTHOR: Zobor, Ervin

TITLE: Reactor Simulators

PERIODICAL: Energia és Atomtechnika, 1960, Vol. 13, No. 6, pp. 478-483

TEXT: The present article offers a brief survey of the various possibilities of designing reactor simulators. The author first specifies the technical fundamentals of a computer, the operation of which is described by a differential equation system which equals the reactor-kinetic equations. Fig. 1 shows a circuit diagram for carrying out linear mathematical operations which are required for the solution of the time-dependent differential equations. The kinetic differential equation system of the reactor is given. Table 2 shows the parameters of retarded neutrons in U²³⁵ fission. The following kinetic simulators are dealt with next: 1) Simulators with symmetric amplifiers: a) Reactivity is adjusted by potentiometers or by a change in resistance and the retardation by series-connected RC-members (Figs. 2 and 3). b) Reactivity is adjusted by a voltage change (Fig. 4). c) Simulators with "T" retarding members (Fig. 5). d) The percentage of retarded neutrons can ✓

Title : Dezincification of Brass Condenser Tubes.

Orig Pub : Rudy i Matal Niercl., 1957, 2, No 3, 93-96

Abstract : Depending on the composition of the alloy, the service life of brass tubes (B.T.) varies from 15-2 years. It has been shown that dezincification (D) may have a superficial or local character and that it is a function of the composition and structure of the alloy. The most dangerous type is pitting (D) whose rate reaches several mm/year. Influence of various additives on brass types: M-70, M-68, M-63 and M-60 has been studied. It has been shown that $\alpha + \beta$ 60/40 brass (Muntz metal) is also prone to (D). More resistant is

TITLE: Investigation of light scattering and viscosity of polyisobutylene solutions

PERIODICAL: Vysokomolekulyarnyye soyedineniya, v. 4, no. 3, 1962,
1257-1261

TEXT: Light scattering was applied to determine the linear functions $c/R'_{90} = f(c)$ and $1/(z' - 1) = f(c)$ and the molecular weight, the second virial coefficient, and the root mean square distance $(\bar{r}^2)^{1/2}$ between the ends of the macromolecule of solutions of polyisobutylene (molecular weight $0.28 \cdot 10^4 - 12.6 \cdot 10^4$) in hexane purified by centrifuging at 20 000 g. The intrinsic viscosity $[\eta]$ of polyisobutylene solutions in hexane, toluene, and θ solvent was also determined. Results:
 $(1) [\eta] = 3.6 \cdot 10^{-4} M^{0.62}$; $[\eta] = 3.2 \cdot 10^{-4} M^{0.62}$; and $[\eta] = 7.6 \cdot 10^{-4} M^{0.5}$ for hexane, toluene, and θ solvent respectively, which is in good agreement with the values obtained by T. Fox, P. Flory (J. Amer. Chem. Soc., 79,

Card 1/2

1909, 1951), and W. R. Kriegbaum and P. Flory (J. Polymer Sci., 11, 37, 1953). (2) The equilibrium flexibility $(h_0^2/h_f^2)^{1/2}$ of polyisobutylene molecules was greater than that of the other vinyl polymers. Calculated from viscosity equilibrium flexibility (1.86) is larger than when calculated by light scattering (1.6). W. Kriegbaum and D. Carpenter (J. Phys. Chem., 59, 1166, 1955) attribute this to dependence of the Flory constant Φ on the type of solvent. Direct measurements of $(h_0^2)^{1/2}$ are to be made, to solve this problem. There are 6 figures and 1 table.

Title : An Experiment on Titration of Aldehyde with 2,4-Dinitro-
Phenylhydrazine

Orig Pub : Zh. analit. khimii, 1956, 11, No 4, 459-462

Abstract : On study of polarographic properties of 2,4-dinitro-phenylhydrazine (I) it was found that with a K_2SO_4 background I produces two waves of $E_1^{\frac{1}{2}} = 0.244\text{v}$ and $E_2^{\frac{1}{2}} = 0.510\text{v}$. With NH_4Cl background half-wave potentials are, respectively, - 0.546 and - 0.808v; with NH_4OH background - 0.566 and - 0.828v. Benzaldehyde (II) produces a wave at potential + 1.0v. By titration at -0.7v there is obtained a rectified portion and a sharp rise of the current following the equivalence point. The resulting residual current (I_a) is constant and does not affect the titration results. On titration with an applied
